It's time for smart living

MEET YOUR SMART DESIRES WITH A TOUCH

Some people are concerned by the prospect of transforming an older home into a smart home when it was built many years ago. Is it worth changing the cabling network just to add a smart panel? Should they simply ignore the convenience of smart solutions? Which brands integrate the best? How long does it take to make a building smart? How do smart products affect a home's interior design? These are some of the most frequently asked questions, and it is quite logical to be concerned about these issues.

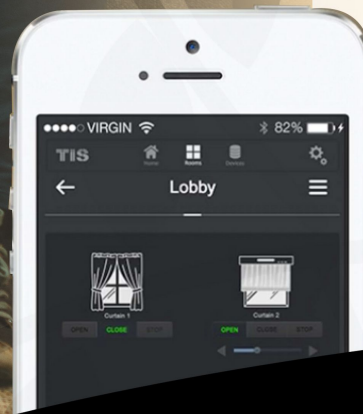

TIS has introduced many functional devices in the home automation market, but what makes these devices significant is not just the rich knowledge behind our experts' innovations. The underlying system with which these devices perform commands is of basic value. There are many reasons why our Air System is one of the most functional systems available.

The most notable feature of Air Systems is that it can be installed at any time, so it is equally useful for a house that was built 40 years ago or one that is currently being built. This makes Air Systems incredibly efficient for any budget. What you're buying is a smart device with many options for which no new cabling is required.

The installation is very easy and takes, at most, half a day to complete, so you do not have to have a whole week planned for installing air solutions.

You are only 3 steps away from an automated home. Install the air system, connect it to Internet, and you are good to go. There is no need for a technician or programmer; since these devices are DIY-oriented, anyone can install and work with our Air System.

Every TIS Air System product has a built-in 2.4 GHz WIFI module that works as a gateway and enables direct connection to the TIS server, so the user can easily control any device without the need for any extra gateway or hardware.

Air System offers a variety of different solutions to cover any automation need you might have. Automate lights' power and dimming features, motors, shutters, temperature, energy savings, audio, and security—all of these are a piece of cake with our Air System products.

You can make your home smart by using just Air System products, or you can integrate with other wireless and wired solutions. Air devices are easily combinable with other TIS wired products. TIS-AIR products share the same protocol as the TIS-BUS system, giving you the option of integrating wired and wireless solutions.

Another benefit of using the Air System is that it considerably reduces the number of switches you need, automating your home while keeping your interior design clean and elegant.

Moreover, because Air System products are equipped with built-in WIFI, they can be controlled from anywhere in the world. They are directly linked to the Internet and are ready to respond to your commands immediately.

Air System products are engineered to work automatically as well. This means that you don't have to worry about being present or even near your phone to make needed adjustments. You can simply set the system to perform a specific action at a specific time and leave the rest to your smart home solution.

All of TIS's Air System devices can also be run with remote controls. So users who prefer classic technology or do not want to use the cell phone app still have plenty of options. We believe in accessibility for all, so all of our devices are intended to be smooth and easy to use for the comfort of all.

Lastly, all Air System products have an energy meter that is very important for those who care about our planet. We are often not aware of how much energy we consume, but Air System products inform you about your consumption. Not only do these devices help you save a considerable amount of energy, they also provide daily, monthly, and yearly reports on your energy consumption, so you can correct your energy usage if needed.

TIS's fully functional Air System is compatible with other smart solutions and helps you create the ideal dream home with a few simple configurations.
