It's time for smart living

ONE NETWORK FOR ALL

Networks are critical when it comes to having various smart devices that perform automated and/or human commands in a connected and harmonious way. Constantly expanding and evolving around your smart needs, TIS offers the BUS wiring system, with the capability of connecting smart devices in order to transform your home. The TIS BUS System is the result of combining technology leadership and digital expertise.

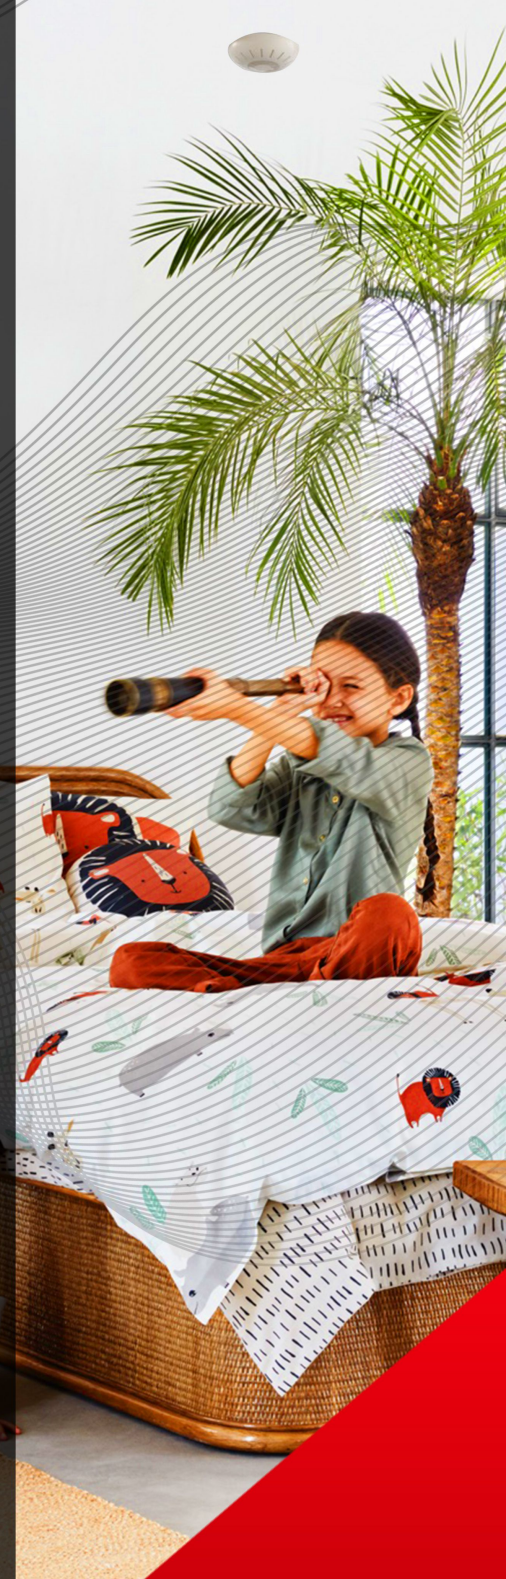

All TIS BUS products are capable of simultaneously monitoring, controlling, and commanding in a smooth and functional way.

Another good thing about the BUS System is that it functions with no blockage or disconnection. Other network systems might break down temporarily due to lack of Internet access, wireless network coverage problems, or other issues, but this system is far more secure due to the stability of being wired, so you do not have to worry about it breaking down.

If needed, this system can be linked with TIS Air products as well, so you are never constrained to only using just wired or wireless products. In addition, the Bus System is large enough to cover 64 smart solutions with one single cable. This number grows to a mind blowing 65280 devices per network if there are several BUS Gateways. Although wired devices are not stand-alone solutions, they are presented in such a wide range that there is no need for integration with other types.

Regardless of whether you want to control the lighting, the audio system, or curtains and shutters, BUS smart products can handle them all.

One of the most important features of the BUS System is that it is so flexible. Smart devices can be linked in any scheme; each device can be directly linked to the power enclosure box, or they can be connected to each other and have a single cable linked to the junction box.

Moreover, there is no data traffic in the BUS System; data length is short, and that enables your system to perform simultaneous commands without any interruption. This means that you can turn on the AC and the living room lights and open the balcony window at the same time without any pause or delay.

We consider it an
honor to enrich our
customers' lives.
Will you let us?

This wired system can centralize your whole automation system, reducing the number of wall panels. This matters aesthetically, since it is easier to design a neat wall than one covered in panels.

With many practical and useful features, the BUS System is the best solution for commercial projects such as hotels, restaurants, hospitals, big houses, and many other luxury projects. The TIS BUS System creates a convenient network of solutions for better control over your building.

The TIS Smart Home Company is thrilled to provide the BUS System, fully functional automation technology for customers with different needs and preferences.
